ABSTRACT

This The purpose of this study is to investigate the elements that influence the process of knowledge sharing and the capacity for innovation among university teachers in Vietnam. The covariance-based structural equation model (CB-SEM) was utilized in the process of conducting data analysis, which was carried out with the assistance of SPSS and AMOS software. The research is based on survey data collected from 380 lecturers, all of whom hold at least a master's degree in subjects that are relevant to the courses that they teach their students. There were five primary characteristics that were identified, along with their respective correlation coefficients, regarding the sharing of knowledge and the consequent impact that it has on the innovative capabilities of lecturers. According to the data, there are substantial correlations between knowledge-sharing and a variety of elements, including as trust, the perceived utility of information and communication technology (ICT), pleasure in assisting other people, knowledge self-efficacy, organizational rewards, and the aforementioned. Furthermore, it was demonstrated that the act of knowledge-sharing itself had a significant influence on the innovative behaviors of individual lecturers. It is clear from these findings that it is essential to cultivate an atmosphere that encourages collaboration and trust, as well as to make use of information and communication technology tools in order to make the sharing of information easier. Considering the findings, the research provides recommendations that can be put into practice with the intention of improving the ways in which university instructors in Vietnam share their knowledge. These recommendations place an emphasis on the establishment of supportive corporate cultures, the promotion of trust-building efforts, and the provision of sufficient resources and incentives. Through the implementation of these tactics, lecturers have the ability to not only enhance their practices of knowledge-sharing but also continuously innovate in their teaching methods, thereby contributing to the general growth of higher education in Vietnam.

Key words: Knowledge-sharing, Innovation Work Behavior, Lecturers

1 INTRODUCTION

2 Universities operate as the knowledge-intensive environments and play a central role in knowledge creation through research, knowledge dissemination through publication, and interpersonal interactions¹. They also play an essential role in knowledge transfer through collaboration between individuals, businesses, and other organizations to support innovation². Thus, how to effectively share knowledge of lecturers in universities in order to create core value as a critical competency. The issue is becoming a concern for many universities globally, particularly in Vietnam. In recent years, the Vietnamese government has continuously introduced policies to facilitate the development of the education sector to meet the human resource needs for the country's economic development. The Vietnamese government believes that education development is a priority among national policies, significantly higher education. In order to

higher education, Vietnamese universities try to develop their research capacity and reduce the gaps with other universities worldwide. First, it is necessary to improve the quality of teaching and consolidate many skills for effective teaching, especially among the lecturers. Constantly improve expertise, enhance mutual knowledge-sharing, and contribute to knowledge innovation in line with development trends of countries worldwide.

The Industrial Revolution 4.0 has dramatically impacted the value of human life and production activities. In this context, knowledge is one of the crucial factors, which is the basis for developing all human productivity in depth. According to research by Wright et al. , human resources, including the skills, experience, and knowledge of employees, can form the competitive advantage for an organization or enterprise³. Jafari et al. also asserted that knowledge is "the most important resource to implement

Cite this article : Duy D T, Thy D A. Which causes knowledge-sharing and innovative work behavior? The case of Vietnamese university lecturers . *Sci. Tech. Dev. J. - Eco. Law Manag.* 2025; ():1-15.

the organization's strategy"⁴ The organization's focus on knowledge has many benefits, including reducing time in the workflow, reducing transaction costs, improving customer services, adapting to new changes, and creating a learning environment, thereby contributing to increased productivity and production efficiency⁵. These benefits demonstrate the importance of knowledge in gaining an advantage in a competitive environment. From the early 1990s onwards, researchers and business administrators worldwide have applied and approached the trend in business development as known as knowledge management. Among those activities, knowledge-sharing is considered a core knowledge management activity knowledge-sharing brings three benefits to organizations⁶. First, knowledge-sharing among employees and departments in the organization is necessary to transfer individual and group knowledge into organizational knowledge, leading to the effectiveness of knowledge management. Second, some studies have found that knowledge-sharing is critical to the success of an organization⁷; when individuals share knowledge, doing it significantly increases an organization's resources, reduces time wasted in trial and error, but reluctantly sharing knowledge will impact the survival of the organization⁸. Many factors affect the desire to share knowledge among employees in an organization^{9,10}. Some authors have also discussed the factors affecting knowledge-sharing in organizations in general and enterprises in particular, which can be attributed to three main areas such as, individual, organizational and technological capacities¹¹. Third, when an individual actively shares knowledge, knowledge is absorbed, thereby creating this condition to promote innovative behavior. These three benefits are the basis for motivating and realizing new insights and knowledge of implementing tasks in the organization. Therefore, the increase of knowledge-sharing will promote employees' innovative behavior, help organizations survive and grow in depth, and improve competitiveness based on existing knowledge and new ideas of human resources.

Most studies on knowledge sharing are concentrated in European and American countries, where knowledge sharing theory was first developed. Research on knowledge-sharing in Asian countries has not been mentioned much, especially in university context¹². Meanwhile, globalization makes the economy competitive on a large scale; knowledge-sharing has tremendous significance for universities in developing countries¹³.

In Vietnam, numerous studies have been conducted to evaluate the impact of knowledge sharing among

employees at enterprises and university lecturers. Specifically, studies conducted by Tran Minh Thanh, Nhung and Loan, and Nguyen Tuan Anh, among others¹⁴⁻¹⁶. These studies have suggested that variables such as trust, school leadership culture, information systems, and reward systems are factors that affect knowledge sharing. The correlation between information sharing and innovation is a pivotal subject of investigation in organizational behavior and management, since it profoundly influences an organization's capacity to adapt and prosper in competitive landscapes. Knowledge sharing denotes the dissemination of information, skills, and experiences among individuals inside an organization, which can cultivate a culture of collaboration and innovation. Studies demonstrate that efficient information dissemination can augment innovation capacities by promoting the exchange of ideas and insights essential for creating new products and services. Diansari et al. discovered that information sharing has a positive correlation with innovation in small and medium companies (SMEs), highlighting that employees who engage in knowledge sharing foster a more inventive organizational culture¹⁷. Hu and Randel's study indicates that tacit knowledge sharing mediates the connection between explicit knowledge sharing and team creativity, implying that businesses should promote both types of information sharing to optimize inventive results¹⁸. Zhou and Li assert that internal knowledge sharing is crucial for radical innovation, enabling firms to utilize their pooled experience and market insights¹⁹. The significance of leadership in cultivating an environment that promotes information sharing is paramount. Transformational leadership has demonstrated the ability to improve information-sharing practices, subsequently enhancing innovation capacities (*"Transformational Leadership, Knowledge Sharing and Innovation Capability: An Empirical Study from Lao Firms"*, 2021). The relationship between information sharing and innovation is crucial for firms aiming to improve their competitive advantage. By fostering a culture of knowledge sharing and collaboration, organizations may harness the creative potential of their staff, resulting in enhanced innovation outcomes and enduring success in the marketplace.

However, there has been no research conducted in Vietnam to assess the impact of knowledge sharing and its effect on the **innovation ability** of university lecturers.

Their big question firms have to ask:

1. What factors affect the knowledge-sharing of Vietnamese university lecturers?

- 145 2. How does knowledge-sharing affect the innova- 195
 146 tive behavior of university lecturers in Vietnam? 196
 147 3. What solutions need to be implemented to en- 197
 148 hance knowledge-sharing and thereby promote 198
 149 the innovative behavior of Vietnamese univer- 199
 150 sity lecturers? 200

151 Stemming from the role of knowledge-sharing and the 201
 152 ability to innovate in-depth development of lecturers, 202
 153 universities, and its operations, this study conduct as 203
 154 follow , section 2 reviews the studies of knowledge- 204
 155 sharing in literature. Section 3 explains the research 205
 156 design and describes the data. Section 4 illustrates the 206
 157 CB_SEM model to demonstrate the analysis. Section 207
 158 5 discusses the managerial implications and mentions 208
 159 the limitations and potential future research. 209

160 **THEORETICAL BACKGROUND FOR**
 161 **THE STUDY**

162 **Knowledge Sharing**

163 Knowledge-sharing is easily recognized as hav- 213
 164 ing many concepts. According to Cummings, 214
 165 knowledge-sharing is defined as information pro- 215
 166 vided to people to work together and solve certain 216
 167 problems, develop new ideas, propose initiatives, or 217
 168 implement policies and processes²⁰. According to 218
 169 Nguyen et,al., knowledge-sharing is a collection of be- 219
 170 haviors related to information exchange or support 220
 171 for others. It is different from sharing the informa- 221
 172 tion, where managers provide information about the 222
 173 organization to employees. While knowledge-sharing 223
 174 has the nature of reciprocal theory, information- 224
 175 sharing can be unidirectional and unsolicited²¹. 225

176 Knowledge-sharing is also defined as the exchange 226
 177 of knowledge (skills, experience, and understand- 227
 178 ing) between individuals in an organization. Liu et 228
 179 al. argue that knowledge-sharing can help employ- 229
 180 ees share knowledge and experiences, which aim to 230
 181 help projects and tasks complete quickly and cost- 231
 182 effectively²². In addition, knowledge-sharing in- 232
 183 volves individuals sharing the organization's informa- 233
 184 tion, ideas, suggestions, and expertise with others. 234
 185 The mechanisms of knowledge-sharing within an or- 235
 186 ganization are also pointed out by the research team 236
 187 such as, the contribution of knowledge to enlarge the 237
 188 organization's database. knowledge-sharing in for- 238
 189 mal and informal interactions with team members 239
 190 and outside the working group; knowledge-sharing 240
 191 in community activities²². In addition, knowledge- 241
 192 sharing is also defined as a deliberate subjective act of 242
 193 making knowledge reused by others through knowl- 243
 194 edge transfer by Lee and Al-Hawamdeh²³; a process 244
 245

of giving and receiving knowledge, in which knowl- 195
 edge creativity and sharing depend on individual con- 196
 scious efforts to enhance knowledge-sharing by Linh 197
 et,al.²⁴. As with knowledge, knowledge-sharing can 198
 be seen in verbal communication activities, while in- 199
 visible knowledge sharing can occur in social activi- 200
 ties, observations, or counseling activities. 201

Many organizations have built-in networking sys- 202
 tems that allow employees to share, exchange, and 203
 access knowledge. However, without a culture of 204
 knowledge-sharing, the benefits gained by the orga- 205
 nization and for individuals would not be high. Em- 206
 ployees in the organization may feel that unfriendly 207
 colleagues lead to precautions in sharing imply too 208
 complex to find the knowledge they want. When a 209
 wary attitude exists, the organization needs to pay at- 210
 tention to the implementation approach of applying 211
 behavioral patterns among employees²⁵. 212

213 **Relationship between innovative work be-**
 214 **havior and knowledge-sharing**

215 Innovation is crucial for the long-term viability of 215
 216 companies since it enables the development of new 216
 217 business models, management practices, strategies, 217
 218 organizational structures, as well as new products or 218
 219 services²⁶. An optimal approach to bolstering an or- 219
 220 ganization's capacity for innovation is to cultivate em- 220
 221 ployees' aptitude for generating novel ideas and fos- 221
 222 tering creative behavior. Human capital, the founda- 222
 223 tion for assessing employees' innovative capabilities 223
 224 and fostering innovation, is a crucial technique for 224
 225 administrators to effectively address global competi- 225
 226 tiveness and environmental uncertainty, and to attain 226
 227 high performance and objectives²⁷. 227

228 Innovative work behavior (IWB) refers to employees' 228
 229 actions to generate, introduce, and apply novel ideas 229
 230 that positively impact the workplace, group, or orga- 230
 231 nization, thereby enhancing overall performance²⁸. 231
 232 This behavior is characterized by deliberate efforts to 232
 233 create and implement advantageous ideas for the ben- 233
 234 efit of individuals, groups, or organizations²⁹. IWB 234
 235 involves a systematic approach to developing new so- 235
 236 lutions, which includes identifying problems, gener- 236
 237 ating responses, and executing those solutions within 237
 238 an organizational context. Åmo and Kolvereid de- 238
 239 scribe IWB as actively seeking to develop new prod- 239
 240 ucts, explore new markets, innovate processes, and 240
 241 form novel combinations³⁰. As a multifaceted and 241
 242 multilevel process, IWB relates to interactions among 242
 243 individuals, groups, and organizations³¹. At the in- 243
 244 dividual level, IWB encompasses the creation, introduc- 244
 245 tion, and application of new ideas within one's role to 245

benefit both the individual and the broader organization³². Kanter: further posits that IWB at both individual and group levels includes actions such as idea generation, collaboration, execution, and delivery³¹. Additionally, at the group level, IWB involves generating, introducing, and implementing novel ideas within a team, to enhance performance and drive organizational success.

Stages of innovative work behavior

Innovative work behavior is divided by Dorenbosch et al. into two stages³³: The process of inventing and executing ideas can be divided into three steps, as outlined by Scott and Bruce: developing ideas that are both beneficial and original, obtaining support for these ideas, and finally implementing the ideas that have already been pushed³⁴. The initial phase involves idea generation, where employees identify challenges and opportunities and actively pursue novel ideas as potential solutions to these issues. The second stage, known as idea protection, involves promoting ideas within the organization to garner support for their future development. This entails forming groups and alliances of qualified persons who possess the necessary competencies to implement these ideas. The third phase involves implementing the developed idea as the main driving force in the day-to-day operations of a group or organization²⁸.

Cummings: also separates innovative work behavior into three phases: the initiation phase, which involves understanding problems and generating ideas or solutions, and the second phase which employees try to promote ideas and build relationships with colleagues to support them; the third stage, employees implement ideas by creating new metrics from previous experience²⁰.

De Jong and Den Hartog also studied innovative work behavior and acknowledged that innovative work behavior consists of three stages^{34,35}. Therefore, this study applied the structure of innovative work behavior in three stages: idea creation, idea promotion, and idea realization.

Based on the analysis into stages, the innovative work behavior scale has been developed by some scholars such as Janssen, De Jong and Den Hartog, and Bysted^{28,35,36}. All scales refer to the proposal, seeking support and implementation of innovative ideas of individual employees. However, in most research on innovative work behavior from 1980 to 2009, the effect of innovative work behavior has been studied extensively at the individual level³⁷. Therefore, the meaning and complexity of innovative work behavior in

organizations at other levels are not well understood and studied. Employees and their colleagues can generate innovative ideas, although fundamental breakthroughs are typically achieved by individuals. However, accomplishing more intricate inventions often necessitates cooperation that draws upon a variety of knowledge, skills, and job responsibilities²⁸.

The relationship between innovative work behavior and knowledge-sharing

Knowledge-sharing is one of the important processes of knowledge management systems because it is a way of transferring hidden knowledge and an increasing basis for new intellectual creativity³⁸. Von Krogh et.al, pointed out that the stage of knowledge creation is the next step and is related to the need for innovation³⁹.

The process of creating knowledge takes place through transformation, which is a process in which one person reveals and shares with others they know. People with limited knowledge of some difficulties from which history captures knowledge from others. King describes the socialization and externalization processes in the theory of knowledge creation as social processes that allow people to interact and share knowledge, resulting in the creation of new knowledge³¹.

Darroch and McNaughton assert that enhancing knowledge-sharing between companies fosters creativity and innovation, enabling the development of novel work methods, procedures, and the transformation of conventional approaches⁴⁰. Moreover, this facilitates organizational growth and improved functioning. Knowledge dissemination is a crucial determinant of organizational innovation. While explicit information has a direct impact on the pace of innovation, tacit knowledge influences the caliber of invention.

Information-sharing is a catalyst that motivates individuals to generate information and convert it into enhanced influence⁴¹. When employees engage in active information sharing, they learn knowledge and create situations that foster their inventive behavior. Holub highlighted that the process of sharing knowledge facilitates the rapid development of critical thinking and creativity⁴². The SECI model, consisting of the processes of socialization, externalization, combination, and acquisition, has been identified as beneficial for both knowledge creation and exchange⁴³. Sharing knowledge has the ability to help create and put into action the ideas of those who receive the knowledge (Mura et al., 2013). Sharing knowledge

349 with colleagues enables individuals to engage in com- 400
 350 munication, exchange ideas, highlight the advan- 401
 351 tages of concepts, and convert them into practical 402
 352 solutions⁴⁴. According to Wang and Noe, persons 403
 353 engaged in knowledge-sharing anticipate that their 404
 354 ideas will be endorsed by their colleagues in the fu- 405
 355 ture, leading to the advancement or execution of new
 356 ideas⁴⁵. These individuals experience higher job sat-
 357 isfaction by placing trust in their supervisors and
 358 coworkers⁴⁶. Employee knowledge-sharing enhances
 359 response time and fosters creativity⁴⁷.
 360 Knowledge-sharing is fundamentally linked to the en-
 361 hancement of creativity and the promotion of inno-
 362 vation within organizations. This relationship is un-
 363 derscored by the fact that when individuals exchange
 364 knowledge, they not only broaden their own exper-
 365 tise but also contribute to a collective pool of insights
 366 that can spark innovative ideas. Devi highlights that
 367 knowledge sharing significantly enhances employees’
 368 skill sets, thereby fostering creativity as individuals
 369 become more adept in their fields⁴⁸. Furthermore,
 370 Jo and Joo assert that knowledge sharing is crucial
 371 for transforming individual knowledge into organi-
 372 zational knowledge, which is essential for continuous
 373 learning and adaptation⁴⁹. Moreover, Islam and Asad
 374 emphasize that employees with strong knowledge ties
 375 are more receptive to innovative concepts, suggest-
 376 ing that knowledge sharing acts as a catalyst for cre-
 377 ativity⁴¹. This is reinforced by Zhou and Li, who ar-
 378 gue that effective internal knowledge sharing is vital
 379 for facilitating product innovation, as it allows for the
 380 integration of diverse perspectives and expertise¹⁹.
 381 Collectively, these studies illustrate that knowledge-
 382 sharing not only enhances individual innovative work
 383 behavior but also cultivates an organizational culture
 384 that prioritizes creativity and innovation.

385 **Research Model**

386 The author constructs a research model for the 400
 387 paper- based on Lin’s research model on knowledge- 401
 388 sharing⁸. This model builds on the overall model of 402
 389 the strategic decision-making process with three as- 403
 390 pects: impact factors, processes, and outcomes. It 404
 391 analyzes the influence of three groups of individual 405
 392 factors (interest in helping others, knowledge auton-
 393 omy), organizational factors (support of senior ad-
 394 ministrators and organizations), and technology fac-
 395 tors (using information and communication technol-
 396 ogy) on knowledge-sharing and its processes. As a re-
 397 sult, there is a relationship with knowledge-sharing.
 398 The author is based on Lin’s research model as this
 399 model has been verified in many studies, including

Podrug et. al. on information and communication 400
 technology company employees, and the research of 401
 this study is also cited in 1,197 articles on the Google 402
 Scholar system⁵⁰. Therefore, it is a trust model that 403
 can be used for empirical research on knowledge- 404
 sharing in organizations (Figure 1). 405

406 **Hypothesis**

407 **The influence of personal factors in the pro-**
 408 **cess of knowledge-sharing**

409 **Enjoyment in helping others**

410 Self-determination theory, as proposed by Deci and 410
 411 Ryan, explores the internal drive that motivates an in- 411
 412 dividual, independent of any external influences or 412
 413 forces⁵¹. The enjoyment derived from assisting oth- 413
 414 ers is a manifestation of self-regulation that is influ- 414
 415 enced by the gratification experienced via engaging in 415
 416 and accomplishing a task. The pleasure derived from 416
 417 assisting others is based on the principle of altruism, 417
 418 which stands in contrast to selfishness, characterized 418
 419 by a commitment to unbiased behavior and selfless 419
 420 care for the well-being of others. Lin contended that 420
 421 knowledge-sharing is driven by the sharers’ intrinsic 421
 422 incentives⁸. Wolfe, C., & Loraas, T. also showed that 422
 423 individuals have an inherent motivation to share in- 423
 424 formation since they derive pleasure from assisting 424
 425 others⁵². Altruism can drive an individual to share 425
 426 knowledge with others, regardless of the personal re- 426
 427 wards they may obtain⁵³. Thus, the author posits the 427
 428 following hypotheses:

429 *Hypothesis H1: The enjoyment of helping others has a*
 430 *positive effect on the process of knowledge-sharing.*

431 **Knowledge self-efficacy**

432 According to Janssen’s social cognitive theory, indi- 432
 433 vidual autonomy is influenced by the capacity to ar- 433
 434 range certain behaviors, enabling people to gain au- 434
 435 tonomy and communicate information through col- 435
 436 laboration. The self-determination hypothesis, as 436
 437 proposed by Deci and Ryan in 2008, defines the dem- 437
 438 and for competence as the desire to possess con- 438
 439 fidence, a clear understanding of what needs to be 439
 440 done, and the ability to independently do tasks⁵¹. 440
 441 Knowledge autonomy refers to an individual’s ability 441
 442 to independently utilize their own knowledge to solve 442
 443 work-related challenges. This skill has been demon- 443
 444 strated to have a positive impact on the sharing of 444
 445 knowledge. Employees who believe that their exper- 445
 446 tise may enhance job efficiency and boost production 446
 447 are more likely to adopt a positive attitude towards 447
 448 knowledge-sharing, leading them to actively engage 448
 449 in sharing knowledge with others⁵². Autonomy can 449

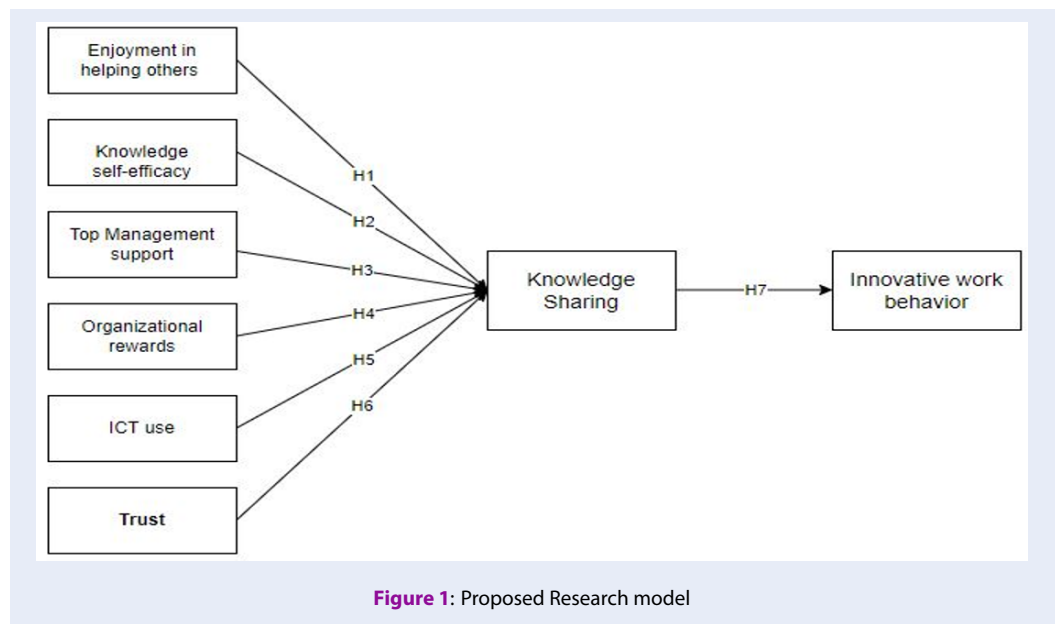

Figure 1: Proposed Research model

450 foster a culture where individuals are motivated to actively disseminate information to their peers⁴⁶. Multiple studies have demonstrated a positive correlation between employees' confidence in their expertise and their willingness to share that knowledge in order to complete their assigned duties^{21,53,54}. Having knowledge autonomy enhances work performance and facilitates the resolution of work-related challenges¹⁶. Consequently, some possibilities are suggested as follows:

460 *Hypothesis 2: Knowledge autonomy has a positive effect on the knowledge-sharing process.*

462 **The influence of organizational factors on knowledge transfer and acquisition processes**

465 The impact of extrinsic motivation on an individual's behavior is determined by Self-determination theory⁵¹ and motivation theory. These theories propose that extrinsic motivation arises from external pressure⁴³. Hence, the external factors that drive individuals to engage in behaviors like knowledge-sharing can include the endorsement of a supervisor, the prospect of getting a reward, and so on.

473 **Top Management support**

474 The extent to which employees actively engage in knowledge-sharing is contingent upon the level of support provided by management inside the business⁵³. The influence of management assistance on knowledge-sharing among employees is widely recognized²³. Islam et al. highlighted the significance

of administrator support in facilitating knowledge-sharing⁵⁵. They noted that leaders play a crucial role in promoting employee learning through the sharing of individual experiences and encouraging employees to transfer knowledge in order to create new knowledge. The research hypotheses that have been suggested are as follows:

487 *Hypothesis 3: Administrator support has a positive effect on the knowledge-sharing process.*

489 **Organizational reward**

490 Organizational rewards have been argued to be useful in encouraging individuals to do what they want³⁸. Organizational rewards include salaries, financial fee bonuses, as well as promotions, and employment security. Islam presented results suggesting that the reward mechanism has a more significant role than technical support in promoting knowledge-sharing⁴¹. Bartol and Srivastava proposed that financial incentives can promote knowledge-sharing by motivating individuals to make personal contributions to databases, engage in formal contacts within and between groups, and share knowledge across different working units³⁹. According to Wolfe and Loraas, incentives have the ability to encourage knowledge-sharing, regardless of its nature, funding, and associated costs⁵². According to Bock and Partners, several studies indicate that knowledge-sharing is more probable when individuals believe that the advantages they gain are greater than the disadvantages they perceive⁵⁶. Hansen and Avital conducted study that posited formal incentives or prizes as the

511 primary variables shaping an employee’s perception
 512 of knowledge-sharing⁵⁷. They suggest that an orga-
 513 nization’s formal incentive strategy directly impacts
 514 an employee’s perspective on knowledge-sharing. Ac-
 515 cording to Connelly and Kelloway, incentives serve
 516 as motivating factors for knowledge-sharing³². Em-
 517 ployees in a business consistently anticipate acknowl-
 518 edgment and compensation for sharing their knowl-
 519 edge and skills with others. Therefore, the author pro-
 520 poses the following hypotheses:

521 *Hypothesis 4: Organizational rewards have a positive*
 522 *effect on knowledge-sharing.*

523 **The influence of technological factors on the**
 524 **process of knowledge transmission and ac-**
 525 **quisition**

526 The utilization of information and communication
 527 technology. The Technology Acceptance Model
 528 (TAM) posits that the utilization of technology in
 529 everyday tasks, relationships, and communication
 530 among individuals or members of a group or soci-
 531 ety has an impact on behavior, such as the sharing of
 532 knowledge. Enhancing knowledge accessibility and
 533 eliminating geographical and temporal obstacles for
 534 knowledge workers can enhance the efficacy of infor-
 535 mation and communication technology (ICT) in fa-
 536 cilitating knowledge-sharing. According to Hendrik’s
 537 study, information and communication technology,
 538 with its capacity to disseminate knowledge through-
 539 out many departments of a business, might facilitate
 540 improved comprehension within the intricate organi-
 541 zational setting^{58,59}. Information technology is often
 542 regarded as an essential instrument for facilitating the
 543 acquisition of valuable knowledge⁴⁷. Collaboration
 544 technologies, including internal network systems, fa-
 545 cilitate cooperation and knowledge sharing among
 546 individuals. This collective knowledge is then inte-
 547 grated into the organization’s overall knowledge base,
 548 enhancing its effectiveness. According to Zhao and
 549 Luo, information technology has a significant role in
 550 reducing barriers to knowledge-sharing³⁷. Teece also
 551 emphasized the importance of information and com-
 552 munication technology in this regard⁶⁰. Identifying
 553 pertinent knowledge across many departments within
 554 an organization is crucial for establishing a technical
 555 framework that facilitates the sharing and distribution
 556 of knowledge. Subsequently, the author puts forward
 557 the subsequent hypotheses:

558 *Hypothesis 5: The use of information and communi-*
 559 *cation technology has a positive effect on knowledge-*
 560 *sharing.*

The relationship between trust and
knowledge-sharing

Trust

Trust is an optimistic anticipation of an individual’s
 integrity, competence, and benevolence towards the
 capabilities of their fellow colleagues within the busi-
 ness. Trust is a significant factor in social connections,
 as opposed to commercial transactions³⁸. Therefore,
 trust will facilitate knowledge-sharing, as voluntary
 sharing of one’s knowledge with another is social ex-
 change theory. A study conducted by Conner and
 Prahalad reinforced the assumption that knowledge-
 sharing is easier if there is mutual trust between
 companies⁶¹. Trust plays a very important role in
 knowledge-sharing⁷. The higher the trust, the eas-
 ier it is to accept knowledge from our peers because
 we believe that knowledge is beneficial to ourselves.
 According to Von Krogh et al., trust and openness in
 the organization promote knowledge-sharing behav-
 iors of employees³⁹. In communication, conversa-
 tion and collaboration among colleagues, managers,
 leaders, encouragement and encouragement of pub-
 lic officials to participate in knowledge activities are
 important. Formal, social, and collaborative relation-
 ships are important in sharing different perspectives
 and knowledge in the workplace. The author agrees
 with the previous study and thinks that in the work-
 place if lecturers have confidence in the experience
 and working capacity of their colleagues, it will moti-
 vate them to share knowledge. Therefore, hypothesis
 H6 is proposed as follows:

Hypothesis H6: If lecturer s receive trust from col-
leagues, they will have more knowledge-sharing behav-
ior.

The relationship between the knowledge-
sharing process and innovative working be-
havior.

Innovative work behavior is defined as ”an individ-
 ual’s act of achieving purposeful initiative and rec-
 ommendation (in a job role, group or organization)
 of new and useful ideas, processes, products or pro-
 cedures”⁴⁰. The act of creative work consists of
 three distinct tasks: idea generation, the develop-
 ment of new ideas; promoting ideas, getting outside
 support; and idea application, the production of a
 model or prototype of an idea^{28,35}. Therefore, pre-
 vious studies have suggested that individuals with
 goodwill and innovative abilities should expand their
 contributions beyond their job requirements and at
 the same time recognize a continuous stream of in-
 novation⁶². Knowledge-sharing is a factor that en-
 courages individuals to create knowledge and turn it

613 into greater power. As employees become more in- 661
 614 volved in the knowledge-sharing process, they acquire 662
 615 a greater amount of knowledge. These conditions fa- 663
 616 cilitate employees' innovative behavior. Therefore, we 664
 617 believe that knowledge-sharing behaviors have a sig- 665
 618 nificant impact on individuals' innovation behaviors: 666
 619 *Hypothesis 7: Knowledge-sharing process has a positive*
 620 *effect on innovative work behavior.*

621 RESEARCH METHODOLOGY

622 Research design

623 Using two tools: focus group interview and question- 667
 624 naire test interview⁶³. The first phase of this research 668
 625 is to uncover insights into the enjoyment scale, knowl- 669
 626 edge efficiency, top management support, organiza- 670
 627 tional rewards, use of information and communica- 671
 628 tion technologies, and knowledge-sharing and poten- 672
 629 tial for innovation, and discussion will comment on 673
 630 preliminary scales. The questionnaire was then sent 674
 631 directly to university lecturers in Ho Chi Minh City, 675
 632 Vietnam. 676

633 Variable measurement

634 The study mainly used a 7-degree Likert scale to mea- 683
 635 sure observation variables, where "1" is "Strongly dis- 684
 636 agree" and "7" is "strongly agree". The scales are ref- 685
 637 erenced from previous studies in the same field. 686

638 The research was conducted in a group discussion 687
 639 with a panel of 08 experts in the field of education 688
 640 management, principals, vice principals, department 689
 641 heads and central directors of universities and colleges 690
 642 located in Ho Chi Minh City. 691

643 Scale calibration results

644 All 8/8 experts interviewed said that the same influ- 692
 645 encing factors as well as observed variables. However, 693
 646 it is necessary to adjust the subject/name to suit the re- 694
 647 search objectives at universities in Vietnam (Table 1). 695
 648 Depending on the complexity of the model and the 696
 649 basic characteristics of the measurement model, Hair 697
 650 et al, propose the following minimum sample sizes: 698
 651 Sample size can affect several aspects. of the SEM, 699
 652 including the model's parameter estimation, suitabil- 700
 653 ity, and statistical capacity. In principle, the larger the 701
 654 sample size, the better, but not less than 200 and the 702
 655 minimum for the SEM model will be 5 times the num- 703
 656 ber of observed variables⁶⁶. In the research model of 704
 657 this topic, there are 31 observed variables, so the min- 705
 658 imum number of samples must be 200. Based on the 706
 659 overall research in Ho Chi Minh City, Vietnam has 707
 660 63 universities (39 public universities, 16 non-public 708
 709

universities and 8 institutes); The author directly dis- 661
 662 tributed 350 questionnaires to the lecturers and staff 663
 664 of universities in Ho Chi Minh City for a period of two 665
 666 weeks to achieve this minimum sample size. 667

665 RESEARCH RESULTS

666 Demographic analysis result

667 In the preliminary quantitative study (Table 2), con- 668
 669 ducting the process with 383 sample questionnaires, 669
 670 the number of votes collected was 361 votes (94.25%), 670
 671 after data processing, the number of votes was used 671
 672 to analyze 350 votes (91.38%), the votes were eligi- 672
 673 ble to perform the standard research set. Statistics of 673
 674 350 observations in quantitative research show that 674
 675 in the sample of lecturers from universities in Ho 675
 676 Chi Minh City, male and female genders are similar 676
 677 (male accounted for 55.14% and female accounted for 677
 678 44.85%); in which the majority are in the age group 678
 679 from 36 to 45 (accounting for 33.42%), followed by 679
 680 the age group of 45 and older (accounting for 32.57%); 680
 681 The educational level of the lecturers who participated 681
 682 in the survey mainly graduated with a master's de- 682
 683 gree or higher (accounting for 95.15 %); the number 683
 684 of trainers with 1 to 5 years of working experience ac- 684
 685 counted for 26.00% of the total observations, followed 685
 686 by 6 to 10 years of experience accounting for 24.57% 686
 687 of the total observations. 687

687 Reliability analysis result:

688 The reliability of the questionnaire scale was tested us- 688
 689 ing Cronbach's alpha for the entire 32-item measure- 689
 690 ment system divided into 8 factors. Cronbach's alpha 690
 691 for scales ranging from 0.771 to 0.861 in the model. 691
 692 Since all measurement confidences are greater than 692
 693 0.7, all results show that the measurements for the 693
 694 scale are reliable. Therefore, the data were explored 694
 695 to be suitable for further analyses. The results of the 695
 696 reliability analysis for each factor are presented in Ta- 696
 697 ble 3. 697

698 Hypothesis testing result

699 From the results of performing CFA analysis to as- 699
 700 sess the suitability of the whole model, the author pro- 700
 701 ceeded to put 32 observed variables that were satisf- 701
 702 ied into the model for SEM analysis and hypothe- 702
 703 sis testing. The author performs SEM analysis from 703
 704 the originally proposed research model and then per- 704
 705 forms model correction to obtain a better model. The 705
 706 official theoretical model proposed by the author in- 706
 707 cludes 6 independent variables: EH, KE, TS, OR, IT, 707
 708 and TR affect an intermediate variable KS, from the 708
 709 variable KS affecting the dependent variable PI. 709

Table 1: Variable measurement

Variable	Measurement Items	Previous research
Enjoyment in helping others (EHOs)	EHO1. I enjoy sharing my knowledge with colleagues. EHO2. I enjoy helping colleagues by sharing my knowledge EHO3. It is gratifying to assist someone by imparting my expertise. EHO4. It brings me great pleasure to share my knowledge with my colleagues.	8,24
Knowledge self-efficacy (KSE)	KSE1. I possess a strong belief in my capacity to offer significant knowledge that is highly regarded by my peers at the institution. KSE2. I possess the requisite proficiency to offer significant insights to my university. KSE3. Sharing my expertise with coworkers (reversed coded) has no impact. KSE4. I have less valuable knowledge compared to most other employees (reversed coded).	8,24
Top management support (TMS)	TMS1. Senior executives believe that promoting the exchange of knowledge among colleagues is advantageous. TMS2. Senior executives consistently endorse and motivate staff to disseminate their expertise among their peers. TMS3. Top managers have a crucial role in providing the required assistance and resources to facilitate the sharing of information among lecturers. TMS4. Senior executives are eager to ensure that the instructors are willing to share their expertise with their peers.	8,24
Expected organizational rewards (EORs)	EOR1. Compensating me with a higher wage for sharing my knowledge with colleagues is appropriate. EOR2. Compensating me with a bigger incentive for sharing my knowledge with colleagues is appropriate. EOR3. Getting promoted for imparting my knowledge to colleagues ought to be the result. EOR4. Increasing my job stability should be a reward for imparting knowledge to colleagues.	8,54
the usefulness of ICT(ICT)	ICT1. Lecturers utilize electronic storage, such as online databases and data warehousing, to efficiently access knowledge. ICT2. Lecturers utilize knowledge networks (including intranets, groupware, and virtual communities) to communicate with their colleagues. ICT3. My university makes use of technology that enables staff members to exchange knowledge within the company. ICT4. Thanks to technology, teachers at my university may disseminate their expertise to those outside the institution.	8,54
Trust	Trust1. I believe that I am treated fairly in an organization. Trust2. I believe I am not harmed when I share my knowledge with my colleagues. Trust3. I believe that other teachers in the school will help me when needed. Trust4. Lectures trust each other at my university.	54,64,65
Knowledge-sharing (KS)	KS1. The knowledge shared by the lectures at my university is accurate KS2. The knowledge shared by the instructors at my university is complete. KS3. The knowledge shared by members of my school is reliable. KS4. The knowledge which is shared by the lecturers of my university is always up-to-date.	65
Innovative work behavior (IWB)	IWB1. I create new ideas for improvements IWB2. I often search for new working methods, techniques, or instruments. IWB3. I'm always working hard to test new ideas. IWB4. I transform innovative ideas into University work.	26,28,34

Table 2: Demographic profile of respondents

Item	Frequency analysis	
	Frequency	Percent (%)
Gender		
Male	193	55.14
Female	157	44.85
Total	350	100
Age		
Under 25	17	4.85
26 - 35	102	29.14
36 - 45	117	33.42
More than 45	114	32.57
Total	350	100
Education		
University Graduated student	52	4.85
Master	131	29.14
Ph.D	101	33.42
Associate Professor/ Professor	33	32.57
Total	350	100
Working experience		
Under 1 year	32	9.14
1 - 5 year	91	26.00
6 - 10 year	86	24.57
More than 10 year	141	40.28
Total	350	100

Table 3: Reliabilities analysis result

Factor	Cronbach's alpha
Enjoyment in helping others	0.803
Knowledge self-efficacy	0.830
Top management support	0.840
Organizational rewards	0.836
ICT use	0.804
Trust	0.771
Knowledge-sharing	0.847
Individual innovative behavior	0.861

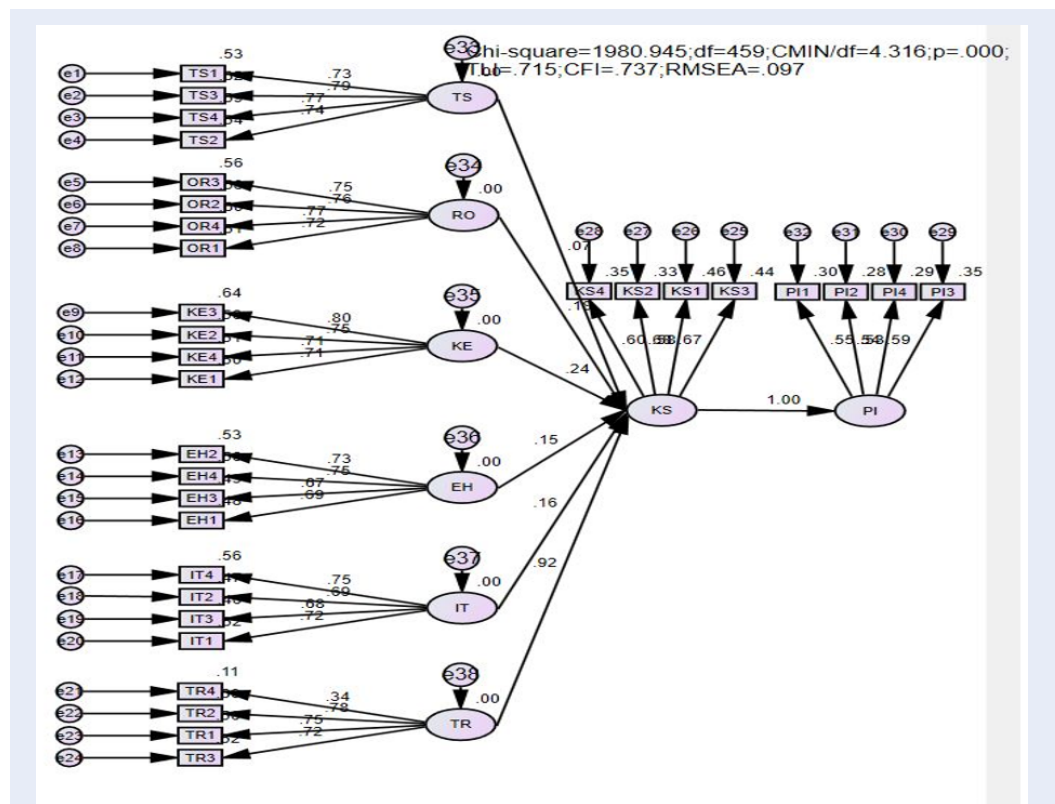

Figure 2: SEM Results of the Research Model

710 Indicators from the results of the first linear structural
 711 model analysis in Figure 2 show that: it can be con-
 712 cluded that the model fits the survey data.
 713 The test results have the following indicators:

714 **CONCLUSION AND DISCUSSION**

715 **Research summary**

716 **Share knowledge with the influence of indi-**
 717 **vidual factors**

718 Knowledge-sharing is concluded to be influenced by
 719 the enjoyment of helping others. Many authors agree
 720 with this statement, including¹⁹. To share knowledge
 721 or not share knowledge depends on the personality
 722 and emotional state of each lecturer. Knowledge is an
 723 individual asset, so when they enjoy sharing, they feel
 724 comfortable with knowledge-sharing, and they will be
 725 willing to pass on their knowledge to their colleagues
 726 and acquire knowledge from their colleagues. This
 727 enjoyment comes from each lecturer, but it cannot be
 728 denied that the surrounding environment has a signif-
 729 icant impact on each individual's mood and feelings.
 730 Thus, in addition to the enjoyment of helping others,
 731 other factors belonging to the organization and

732 technology can promote knowledge-sharing among
 733 instructors at universities in Ho Chi Minh City, Viet-
 734 nam.

735 **Share knowledge with the influence of orga-**
 736 **nizational factors**

737 Knowledge efficiency and Organizational rewards: As
 738 a result of quantitative analysis, it was found that
 739 the organization's reward and knowledge effect af-
 740 fect knowledge-sharing. Many authors also agree
 741 with this statement such as Han and Anantatmula,
 742 Al-Qadhi et al., Podrug et al., and even Lin con-
 743 cluded that knowledge effectiveness and school re-
 744 wards influence both central processes of knowledg-
 745 e-sharing, namely, knowledge transmission and acqui-
 746 sition^{8,50,53,67}.

747 **Share knowledge with the impact of technol-**
 748 **ogy factors**

749 Using Information and Communication Technology:
 750 Information and communication technology is a fac-
 751 tor influencing knowledge-sharing. This conclusion
 752 coincides with many studies, including those by Bock
 753 et al; Podrug et al.^{50,56}. However, when studying the

Table 4: Hypothesis testing result

			Estimate (β)	S.E.	C.R.		H-test
KS	<—	TS	.060	.031	1.913	.056	Rejected
KS	<—	RO	.149	.033	4.519	***	Supported
KS	<—	KE	.199	.034	5.800	***	Supported
KS	<—	EH	.129	.034	3.819	***	Supported
KS	<—	IT	.129	.032	3.999	***	Supported
KS	<—	TR	1.648	.285	5.789	***	Supported
PI	<—	KS	.886	.089	9.922	***	Supported

754 impact of information and communication technol-
 755 ogy use on the two processes of knowledge transmis-
 756 sion and acquisition, the author Lin concluded that
 757 the use of information and communication technol-
 758 ogy only affects knowledge acquisition but not knowl-
 759 edge transmission⁸. Lin argued that in employee or-
 760 ganizations, knowledge tends to be used to an indi-
 761 vidual’s advantage, not as an organization’s resources,
 762 so knowledge cannot be shared simply through online
 763 databases or internal networks⁸. By the Structural
 764 Equation Modeling of Analysis (SEM) with the ob-
 765 served sample of university lecturers in Ho Chi Minh
 766 City, the author affirms that the use of information
 767 and communication technology supports knowledge-
 768 sharing. This conclusion was derived from quanti-
 769 tative research and proved by many scholars around
 770 the world. Universities in Ho Chi Minh City have
 771 paid much attention to technology investment, espe-
 772 cially during the Covid-19 pandemic that has taken
 773 place over the past 2 years, in which universities have
 774 actively invested in technology; use, maintain and
 775 regularly update critical information infrastructure;
 776 actively invest in building a social network system,
 777 group software system, and an intranet system that
 778 will create conditions for lecturers to actively share
 779 knowledge.

780 Effect of Trust on Knowledge-Sharing

781 Research results suggest that knowledge-sharing is in-
 782 fluenced by the trust of instructors. This conclusion
 783 aligns with the findings of several investigations, in-
 784 cluding the research conducted by Davenport and
 785 Prusak, Costa et al., and Zárraga and Bonache^{7,68,69}.

Exploitation of trust will be prevented, and teachers
 will actively share knowledge by relying on trust in
 the honesty, responsibility, and credibility of their col-
 leagues. They will impart their expertise and abil-
 ities to their colleagues only if they trust that their
 colleagues will not exploit that knowledge and talents
 to challenge them or feign closeness solely to benefit
 from their generosity. In this study, in order to en-
 hance knowledge-sharing in universities in Vietnam,
 the university administrators need a solution to influ-
 ence the trust of each lecturer.

**Knowledge sharing and innovative work be-
 havior**

Numerous research have examined the correlation
 between knowledge-sharing and innovative work be-
 havior. Several studies that recognize this correla-
 tion include the research conducted by Radaelli et
 al, Jaber, and Akram et al.^{43,70,71}. According to re-
 search conducted at universities in Ho Chi Minh City,
 the author has determined that there is a correlation
 between knowledge-sharing and individual inventive
 work behavior. The rigorous quantitative investiga-
 tion revealed a statistically significant association be-
 tween knowledge-sharing and individual innovative
 work behavior. The interpretation of these data is
 based on the findings from the interview with the lec-
 turer. During the interview, the author observed that
 instructors who engage in proactive communication
 and seek knowledge tend to be highly involved in col-
 laborating with colleagues to provide innovative ideas
 for practical implementation.

817 **Limitations and directions for further re-**
818 **search**

819 **Limitations**

820 In this study, we conducted only a small survey
821 of instructors working in HCMC, Vietnam, and we
822 have not yet been able to deploy widely across Viet-
823 nameese countries. Based on the theoretical model
824 of knowledge-sharing by Lin, Linh et.al, etc., pro-
825 posed, we only conduct empirical verification to see
826 the model. This is suitable for the teaching commu-
827 nity of universities in Vietnam, without looking for
828 other variables that may affect knowledge-sharing as
829 well as individual innovation ability.

830 **Directions for further research**

831 In order to enhance the quality of the data acquired,
832 we want to broaden the survey coverage in various
833 university sites in Vietnam by conducting a greater
834 number of surveys. Furthermore, apart from the
835 characteristics suggested by Lin, Linh et.al, and oth-
836 ers, we will broaden our investigation to identify addi-
837 tional factors that impact the knowledge-sharing pro-
838 cess and innovation skills of university professors in
839 Vietnam.

TÓM TẮT

Mục đích của nghiên cứu này là tìm hiểu các yếu tố ảnh hưởng đến quá trình chia sẻ kiến thức và năng lực đổi mới của giảng viên đại học tại Việt Nam. Mô hình phương trình cấu trúc dựa trên hiệp phương sai (CB-SEM) đã được sử dụng trong quá trình tiến hành phân tích dữ liệu, được thực hiện với sự hỗ trợ của phần mềm SPSS và AMOS. Nghiên cứu dựa trên dữ liệu khảo sát thu thập được từ 380 giảng viên, tất cả đều có ít nhất bằng thạc sĩ về các môn học có liên quan đến các khóa học mà họ giảng dạy cho sinh viên. Có năm đặc điểm chính đã được xác định, cùng với hệ số tương quan tương ứng của chúng, liên quan đến việc chia sẻ kiến thức và tác động tiếp theo của nó đối với khả năng đổi mới của giảng viên. Theo dữ liệu, có mối tương quan đáng kể giữa việc chia sẻ kiến thức và nhiều yếu tố, bao gồm lòng tin, tiện ích được nhận thức của công nghệ thông tin và truyền thông (ICT), niềm vui khi giúp đỡ người khác, hiệu quả kiến thức, phần thưởng của tổ chức và những điều đã đề cập ở trên. Hơn nữa, nghiên cứu đã chứng minh rằng bản thân hành động chia sẻ kiến thức có ảnh hưởng đáng kể đến hành vi đổi mới của từng giảng viên. Rõ ràng từ những phát hiện này rằng việc tạo ra bầu không khí khuyến khích sự hợp tác và tin tưởng là điều cần thiết, cũng như sử dụng các công cụ công nghệ thông tin và truyền thông để việc chia sẻ thông tin trở nên dễ dàng hơn. Xem xét những phát hiện này, nghiên cứu đưa ra các khuyến nghị có thể đưa vào thực tế với mục đích cải thiện cách thức giảng viên đại học tại Việt Nam chia sẻ kiến thức của họ. Những khuyến nghị này nhấn mạnh vào việc thiết lập văn hóa hỗ trợ, thúc đẩy các nỗ lực xây dựng lòng tin và cung cấp đủ nguồn lực và động lực. Thông qua kết quả nghiên cứu này, giảng viên không chỉ có khả năng nâng cao hoạt động chia sẻ kiến thức của mình mà còn liên tục đổi mới phương pháp giảng dạy, qua đó đóng góp vào sự phát triển chung của giáo dục đại học tại Việt Nam.

Từ khoá: Chia sẻ kiến thức, Hành vi đổi mới công việc, Giảng viên
