ABSTRACT

This study investigates the interplay between corporate social responsibility (CSR), ESG practices, and business performance within the ASEAN-6 region, focusing on the under-explored role of carbon control. A critical area for further research is the differential impact of ESG on businesses with varying levels of financial performance. It examines the impact of environmental, social, and governance (ESG) initiatives on profitability, using Return on Assets (ROA), Return on Equity (ROE), and a variable denoted by Q. Using data from Refinitiv Eikon's business reports for the period 2016-2022, we employ the GMM regression to address potential endogeneity issues. Quantile regression analysis can be used to explore deeper into the differences in the effects of ESG on companies with varied financial performance levels. The research reveals a positive relationship between a business's ESG score, emissions score, and business performance. Interestingly, this study shows the differential impact of ESG and carbon control across financial performance quantiles. The study proposes practical policy recommendations to empower sustainable development for emerging countries. This research contributes to the existing body of knowledge in several significant ways. First, it adds to the ongoing scholarly debate regarding the relationship between ESG and financial performance, offering empirical evidence from the ASEAN-6 region. Second, it provides compelling evidence of the crucial impact of carbon control on business performance, which is increasingly vital in climate change. Third, it provides empirical evidence of the complexity of this relationship, showing differential impacts across many financial performance quantiles. By incorporating these elements, the study offers a comprehensive and insightful analysis that advances our understanding of the critical interplay between CSR, ESG, carbon control, and business performance in ASEAN-6.

Key words: ASEAN, CSR, ESG, Financial performance, Sustainable development

1 INTRODUCTION

2 Growing consciousness regarding issues like inequal- 23
3 ity and climate change has increased the tendency to 24
4 invest in socially responsible ways. Investing with an 25
5 emphasis on Environmental, Social, and Governance 26
6 (ESG) aspects is gaining traction and supports both 27
7 sustainable development and financial development. 28
8 ESG is growing more important to investors in the fi- 29
9 nancial sector, both individual and institutional. ESG 30
10 integration, or carefully incorporating environmen- 31
11 tal, social, and governance (ESG) issues into decisions 32
12 regarding investments, is the most popular approach 33
13 to environmental, social, and governance (ESG) in- 34
14 vesting among institutional investors worldwide in 35
15 2021, according to survey data. Since 2019, the adop- 36
16 tion rate of ESG integration has more than doubled, 37
17 and by 2021, it will stand at 48%. In general, the adop- 38
18 tion of ESG practices is increasing, while the percent- 39
19 age of people who do not use ESG practices has in- 40
20 creased, minimizing gradually over this time.¹ 41
21 While not mandated by law, our data aligns with 42
22 Raghavan's² findings that ESG disclosure strengthens 43
44

a company's financial well-being. This trend under- 23
scores the growing importance of social responsibility 24
and environmental considerations in business man- 25
agement. According to McKinsey projections, \$9.2 26
trillion in yearly capital expenditures across all eco- 27
nomic sectors will be necessary to achieve net zero 28
by 2050. Furthermore, the Disinflation Act and the 29
Green New Deal have pledged \$370 billion and 1 tril- 30
lion euros, respectively, to reach net zero. McKin- 31
sey's analysis indicates that despite all these devel- 32
opments, a sizable investment gap still needs to be 33
closed. (McKinsey, 2023) 34
In the Association of Southeast Asian Nations 35
(ASEAN), among other places, ESG practices are a 36
new, rapidly expanding worldwide corporate trend. 37
Ten Southeast Asian nations comprise ASEAN: 38
Brunei, Cambodia, Indonesia, Lao, Malaysia, Myan- 39
mar, Philippines, Singapore, Thailand, and Viet- 40
nam. These countries have a combined population 41
of 664 million and a GDP valued at 3.35 trillion USD 42
(ASEAN Secretariat, 2022). Due to shifting local laws, 43
pressure from abroad (mainly from industry), and a 44

45 quickly expanding economy, the area is becoming in- 98
 46 creasingly recognized as an ESG focus. 99
 47 The economies of ASEAN are welcoming of outside 100
 48 investment and trade. About 12% of all foreign di- 101
 49 rect investment went to ASEAN in 2020–2021, and 102
 50 roughly 45% of the region’s GDP came from exports. 103
 51 This exposure to international markets and investors 104
 52 is driving the adoption of ESG. The primary external 105
 53 effects on ESG practices in member nations are cov- 106
 54 ered in this section, with particular attention paid to 107
 55 the roles played by global supply chains and institu- 108
 56 tional finance and the particular advancements that 109
 57 have come about as a result. from the US and Eu- 110
 58 rope, respectively. The US and Europe are significant 111
 59 trading and investment partners for ASEAN and have 112
 60 significantly impacted the region’s implementation of 113
 61 environmentally friendly (ESG) standards. 114
 62 ESG research is conducted at the corporate and na- 115
 63 tional levels; however, the results are inconsistent due 116
 64 to the inconsistent use of data and context. Although 117
 65 effect relationships are assumed in all investigations, 118
 66 impact patterns will be reflected in the data’s form. 119
 67 Since companies are the backbone of any nation, com- 120
 68 paring the nations’ markets where foreign investors 121
 69 participate in ASEAN is essential to gain a partner’s 122
 70 viewpoint on ESG in ASEAN (Habib and Mourad)³. 123
 71 The Report on ESG Practices in ASEAN and Korea 124
 72 – Pathways to Sustainable Development states that 125
 73 ASEAN has been putting numerous initiatives into 126
 74 place to create a sustainable community, such as clean 127
 75 energy, gender equality, migrant worker protection, 128
 76 green finance, the circular economy, and forest pro- 129
 77 tection. Even though there has been a lot of progress, 130
 78 ASEAN still has many obstacles to overcome before 131
 79 achieving these objectives. However, ASEAN is pro- 132
 80 gressively creating a sustainable future for the re- 133
 81 gion through strong collaboration among its member 134
 82 states, as seen by several efforts about ESG practices 135
 83 in the area: ASEAN Plan of Action for Energy Coop- 136
 84 eration, ASEAN Declaration on the Implementation 137
 85 of the ASEAN Community Vision 2025 and Sustain- 138
 86 able Development Goals (2017), ASEAN Taxonomy 139
 87 for Sustainable Finance (2021), and Framework for 140
 88 Circular Economy for the ASEAN Economic Com- 141
 89 munity (2021). 142
 90 Investigating how social responsibility (ESG), partic- 143
 91 ularly carbon reduction, affects the financial success 144
 92 of businesses in developing nations is more impor- 145
 93 tant than ever in light of the increasingly severe ef- 146
 94 fects of climate change. Under much strain from cli- 147
 95 mate change, these nations must develop sustainable 148
 96 ways to boost their economies. To enhance and assess 149
 97 the effect model across various financial performance

levels, this study uses quantitative approaches to ex- 98
 99 plore impact analysis based on regression methods, 100
 101 quantile regression, and decomposition techniques. 102
 Numerous studies have demonstrated that by offer- 103
 ing targeted answers and activities to address envi- 104
 105 ronmental, social, and economic concerns, the im- 106
 107 plementation of ESG strategies has an essential re- 108
 109 lationship to the SDG goals. ESG (environmental, 110
 social, and governance) principles are a fundamen- 111
 tal component of sustainable development, and have 112
 attracted attention from policymakers, governments, 113
 the public, and academics to meet the sustainable de- 114
 115 velopment goals (SDGs)⁴⁻⁷. 116

To fill the existing research gap on the relationship 111
 between social responsibility, carbon control, and fi- 112
 113 nancial performance at the corporate level in emerg- 114
 115 ing market countries, the topic ”corporate social re- 116
 sponsibility and business performance” was selected. 117
 The role of carbon control, and neglected compo- 118
 119 nents in the connection between social responsibility 120
 and financial performance in developing countries, 121
 will be thoroughly investigated in this study. Eval- 122
 123 uating how social responsibility and carbon control 124
 enhance financial performance is vital, given the ur- 125
 126 gency of climate change and the growing desire for 127
 sustainable development. The research offers specific 128
 policy and management recommendations tailored to 129
 each country’s unique roadmap, promoting responsi- 130
 131 ble environmental practices and a low-carbon econ- 132
 133 omy. 134
 135

The complex relationship between carbon control, en- 128
 129 vironmental, social, and governance (ESG) variables, 130
 and corporate financial success is examined in this pa- 131
 132 per, focusing on how these interactions change de- 133
 134 pending on the performance level. Although panel 135
 data models (fixed/random effects) and OLS, two con- 136
 137 ventional regression techniques, could be used, they 138
 have limitations when examining data across quan- 139
 140 tiles. When estimating distinct quantiles, these tech- 141
 142 niques either significantly reduce the sample size or 143
 144 fall short in addressing the impact of outliers, a com- 145
 146 mon characteristic of financial datasets. 147
 148

Quantile regression, pioneered by Koenker and Bas- 140
 141 sett⁸, offers a more robust approach⁸. It enables the 142
 143 estimation of explanatory variable coefficients at spe- 144
 145 cific quantiles of the dependent variable’s distribution, 146
 147 leveraging the full dataset and mitigating the impact 148
 149 of outliers. This is particularly relevant in finance, 150
 where data often exhibit skewness and extreme val- 151
 152 ues. Following established practice in the finance lit- 153
 154 erature, we focus on the 10th, 25th, 50th, 75th, and 155
 156 90th quantiles of financial performance⁹⁻¹¹. 157

150 Our quantile regression analysis reveals a complex
 151 and heterogeneous relationship between ESG/carbon
 152 controls and financial performance. Crucially, the
 153 magnitude of the impact of ESG and carbon controls
 154 on financial performance is not uniform across the
 155 performance spectrum. We find that these effects are
 156 more pronounced for firms exhibiting higher levels of
 157 financial performance.
 158 These findings offer valuable insights for both aca-
 159 demics and practitioners. We gain a more granular
 160 understanding of the intricate links between ESG, car-
 161 bon management, and financial performance by em-
 162 ploying quantile regression. This study contributes
 163 to the existing body of knowledge in finance and
 164 provides actionable managerial implications. Busi-
 165 nesses can leverage these insights to tailor their strate-
 166 gies to their specific performance context, optimiz-
 167 ing operations and progressing towards sustainabil-
 168 ity goals. In conclusion, this research demonstrates
 169 the importance of utilizing appropriate methodologi-
 170 cal approaches, such as quantile regression, to unravel
 171 the complex dynamics within the financial landscape
 172 and effectively analyze the heterogeneous impacts of
 173 ESG and carbon controls on firm performance.
 174 In addition, the study will propose governance impli-
 175 cations to encourage businesses to implement social
 176 responsibility and control carbon more effectively,
 177 while raising public awareness of the importance of
 178 sustainable development. This study contributes to
 179 realising the Sustainable Development Goals (SDGs)
 180 on climate action and economic growth.

181 **LITERATURE REVIEW AND**
 182 **HYPOTHESIS**

183 There are many approaches to social responsibility
 184 (Corporate Social Responsibility - CSR). Carroll¹² af-
 185 firmed that Social Responsibility is the responsibil-
 186 ity of businesses to the economy, society, and the en-
 187 vironment. In addition, Carroll¹³ also proposed the
 188 concept of CSR according to the pyramid model.
 189 According to the World Business Council for Sustain-
 190 able Development's view on corporate CSR, "Corpo-
 191 rate CSR is the commitment of businesses to con-
 192 tribute to sustainable economic development through
 193 compliance with standards on environmental protec-
 194 tion, gender equality, labor safety, fair wages, em-
 195 ployee training and development, community devel-
 196 opment, product quality assurance... in a way benefi-
 197 cial for businesses, as well as the general development
 198 of society.
 199 ESG first appeared in 2004 in the United Nations'
 200 "Who Cares Wins" report. Over nearly two decades,

201 ESG has changed from a set of specialized standards
 202 that evaluate the overall business picture of a business
 203 as a basis for financial investors to a general term to
 204 refer to how.
 205 Businesses are vital to the goals of sustainable devel-
 206 opment. Their efforts are crucial in directing long-
 207 term sustainable development since their commercial
 208 operations directly impact society and the environ-
 209 ment. Businesses must use sustainability reporting
 210 as a vital tool to promote stakeholder responsibility,
 211 show stakeholders how committed they are to sus-
 212 tainable development, and make their activities vis-
 213 ible. The relationship between corporate value and
 214 ESG has gained increased attention since the intro-
 215 duction of dual carbon objectives. Stakeholder the-
 216 ory, signaling theory, and the natural resource-based
 217 viewpoint are examples of analytical stances². The
 218 relationship between a company's cost of capital and
 219 its ESG scores has been a topic of numerous ESG re-
 220 search^{2,3}.
 221 A company's concern for sustainability and compli-
 222 ance in business, as well as reducing shortsighted
 223 conduct during the development process, is demon-
 224 strated by its favorable ESG performance⁴. Another
 225 strategy, ESG/CSR, has contradictory hypotheses and
 226 results and is strongly tied to markets, ownership and
 227 leadership traits, corporate risk, performance, and
 228 value.⁵
 229 Though this perspective highlights that ESG ratings
 230 can properly indicate how corporations engage with
 231 specific CSR concerns, they represent corporate social
 232 responsibility¹⁵. Another perspective holds that com-
 233 panies can become more accountable to society and
 234 investors by focusing on their ESG performance. Re-
 235 sources will be more readily available to socially con-
 236 scious businesses¹⁶.
 237 Numerous scholarly investigations have demon-
 238 strated a favorable correlation between environmen-
 239 tal factors and corporation value¹⁷⁻¹⁹. Furthermore,
 240 Juan Wang²⁰ highlights the favorable correlation be-
 241 tween financial success (ROA, Q) and carbon control.
 242 Analytically, several studies have found a positive
 243 relationship between a company's environment and
 244 FP²¹⁻²³, even though many authors support a nega-
 245 tive or neutral association between EP and FP^{24,25}.
 246 Many recent studies have focused on the relationship
 247 between carbon emissions and FP. Nevertheless, the
 248 findings from some research have led to a lot of debate
 249 and made it challenging to make assessments regard-
 250 ing the impact.
 251 According to Trinks: businesses that use less carbon
 252 perform better profitably²⁶. After investigating 289

Chinese companies²⁷, concluded that environmental information reporting, directly and indirectly, improves corporate financial performance (via analyst coverage, report volume, and analyst count). ESG and sustainable development^{27,28}, ESG frameworks and standards²⁹, and ESG governance policies³⁰. The relationship between ESG and financial performance³¹. ESG reporting and investor behavior^{32,33}. Some of the noteworthy findings are the following: boosting stakeholder interactions³⁴, raising business competitiveness in the market³⁵, and improving corporate reputation³⁶. Improving anticipated future cash flows reducing the cost of stock³⁷, and lowering business risk^{38,39} and the increasing demand for green resources over time⁴⁰. There is debate concerning the relationship between ESG and financial performance, and little is known about how ESG and carbon control interact. Legitimacy theory posits that businesses must meet societal expectations, including transparent ESG reporting, to maintain their operating license⁴⁰. Resource dependence theory emphasizes the importance of managing relationships with external stakeholders and meeting their demands for ESG information⁴¹. Stakeholder theory broadens the focus of corporate responsibility beyond shareholders to encompass all affected parties, arguing that strong ESG performance benefits all stakeholders and contributes to long-term value creation⁴². This can translate to improved financial performance, reduced risk, and enhanced access to capital. However, agency theory⁴³ cautions that potential conflicts of interest between managers and shareholders may lead to suboptimal allocation of resources to ESG initiatives. Finally, signaling theory suggests that voluntary ESG disclosure acts as a positive signal to investors and other stakeholders, conveying a commitment to sustainability and good governance, thereby enhancing reputation and attracting investment⁴⁴. These theories provide a robust framework for understanding the complex interplay between ESG factors and corporate performance. They highlight the multifaceted nature of ESG, moving beyond purely ethical consideration to a crucial element of sustainable business practice in the face of growing stakeholder scrutiny and evolving societal expectations. Many studies on ESG and carbon control are conducted at the corporate level, using the same data sources, leading to limited comparison and analysis due to differences in culture, regulation, and economic conditions between regions. Furthermore, the

level of adoption of ESG practices and disclosure requirements may vary across countries within the same region, affecting comparability. More research is needed to analyze the impact of ESG and carbon controls in specific regional contexts, while also considering distinct cultural factors, regulations, and economic conditions. Another concern is that climate change caused by carbon dioxide (CO2) emissions has evolved into a global challenge, requiring investors and businesses to reallocate capital to support ESG and reshape financial markets⁴⁵. ASEAN markets offer a compelling choice for researchers seeking regionally diverse samples with unique characteristics. While classified as emerging economies, ASEAN nations showcase distinct regulatory frameworks, such as the definition of Islamic finance present in Malaysia and Indonesia. This heterogeneity within a single region makes ASEAN markets a more cost-effective option for concluding regional diversification than analyzing broader global samples.

RESEARCH METHODS

Empirical Model

Accounting or market-based metrics can quantify a company's financial performance⁴⁶. Using a stakeholder theory approach, Q is chosen as an indicator of the market-based financial performance of the company based on ROA, ROE, and market conditions. Q represents investors' expectations for the future. This is significant because when taking into account the efficacy of adopting social responsibility, the benefits of Q cannot be achieved immediately. The concepts of ESG and CSR may have similarities and can be interpreted using similar variables but are not interchangeable. CSR encompasses strategic elements of a company that are not always captured by ESG scoring. In contrast, ESG scoring precisely measures CSR issues. According to Gillan ESG scoring can be viewed as an extension of CSR strategies, as ESG issues are rooted in CSR strategies⁴⁷. Based on a combination of appropriate literature and theories, the author builds an analytical model as follows

$$\begin{aligned}
 FP_{it} = & \delta_0 + \delta_1 ESG_{it} + \delta_2 EESGCon_{it} \\
 & + \delta_3 ENV_{it} + \delta_4 SOC_{it} + \delta_5 GOV_{it} \\
 & + \delta_6 CSRstra_{it} + \delta_7 CSRC_{it} + \delta_8 CSRS_{it} \\
 & + \delta_9 CSR Audit_{it} + \delta_{10} CSRSCCommittee_{it} \\
 & + \delta_{11} Emissions_{it} + \delta_{12} Total carbon_{it} \\
 & + \delta_{13} DE_{it} + \delta_{14} LE_{it} + \delta_{15} LDA_{it} \\
 & + \delta_{16} SDA_{it} + u_{it}
 \end{aligned}$$

348 FP_{it} : financial performance of firm i at year $t = \{ROA,$
 349 $ROE, Q\}$
 350 Control variables = $\{LEV, SDA, LDA, DE\}$.
 351 Variables are presented on Table 1.
 352 The calculation of pillar scores is illustrated in Table 2.

353 Sample

354 The author uses ReInfinativ Eikon data from 2016 to
 355 2022, businesses in six nations including Singapore,
 356 Indonesia, Thailand, Malaysia, Philippines, and Viet-
 357 nam have been selected. The industries include En-
 358 ergy, Basic Materials, Industrials, Consumer Cycli-
 359 cals, Consumer Non-Cyclicals, Financials, Health-
 360 care, Technology, Utilities, and Real Estate.
 361 The author designed the data and removed any miss-
 362 ing or empty values after gathering it. A balanced
 363 panel data set with 731 observations was the last out-
 364 come of the data-cleaning process.

365 Method

366 Using the fixed influencing factors model (FEM), ran-
 367 dom influencing factors model (REM), and pooled re-
 368 gression model (Pooled OLS) is the quantitative ap-
 369 proach.

370 If there is autocorrelation or heteroskedasticity, do
 371 not utilize the Pooled OLS estimation method af-
 372 ter looking for regression model violations if there is
 373 significant multicollinearity. based on the outcomes
 374 of the selection test, the generalized least squares
 375 method (GLS) will be used to produce the final re-
 376 gression result, and the GMM (SGMM or DGMM)
 377 will decide the final regression.

378 To check for undue limitations and the model's
 379 appropriateness- that is, whether it makes sense to use
 380 the instrumental variables the model includes - use
 381 the Sargan or Hansen test.

382 Use the AR test to determine residual correlations
 383 and select the DGMM approach over the traditional
 384 GMM method.

385 This study demonstrates that ESG and carbon con-
 386 trol have an impact on financial performance, based
 387 on the above arguments made above regarding the re-
 388 lationship between the impact of the ESG index and
 389 CSR implementation factors on FP^{49,50}.

390 From the viewpoints of resource-based theory, stake-
 391 holder theory, legitimacy theory, and signaling the-
 392 ory, companies need to be open and honest in sharing
 393 information with all parties involved, not just share-
 394 holders. As a result, successful CSR/ESG implemen-
 395 tation will enhance financial performance and en-
 396 hance stakeholder satisfaction while lowering risks.

397 Because the technique allows us to estimate vari-
 398 ous distribution quantiles, quantile regression offers

greater flexibility. Compared to OLS, quantile regres- 399
 sion is less susceptible to outliers by reducing the sum 400
 of the absolute values of the errors. We can use quan- 401
 tile regression to investigate the intricate link between 402
 variables X and Y at various Y levels. Instead of focus- 403
 ing only on the average, we can obtain a more thor- 404
 ough and detailed picture of how X affects Y . The im- 405
 pact of variable X on variable Y is only estimated at 406
 the average level using conventional estimation tech- 407
 niques based on the error minimization rule, which 408
 concentrates on the middle portion of variable Y 's dis- 409
 tribution (Koenker & Basset, 1978)⁵¹. Meanwhile, 410
 the quantile regression estimation method gives ro- 411
 bust results in the presence of outliers. The study's 412
 objective is to examine the variables whose effects 413
 change at different quantiles of the dependent vari- 414
 able. Although OLS regression, fixed-effects, and 415
 random-effects models can be used to estimate the 416
 coefficients at each quantile separately, this method 417
 leads to a significant reduction in the number of ob- 418
 servations and does not address the problem of out- 419
 liers. In contrast, quantile regression, while still es- 420
 timating the coefficients of explanatory variables at 421
 each quantile of the dependent variable, makes full 422
 use of the data and can handle outliers well. There- 423
 fore, this thesis uses quantiles 10, 25, 50, 75 and 90, a 424
 common approach in financial studies when applying 425
 quantile regression⁹⁻¹¹. 426

It is anticipated that the use of ESG, carbon control, 427
 and social responsibility will have a positive impact 428
 on financial performance. The study proposes the fol- 429
 lowing hypothesis: 430

This study demonstrates that ESG and carbon control 431
 positively affect financial performance based on the 432
 previous evidence regarding the relationship between 433
 ESG index impact and CSR implementation factors 434
 on financial performance⁵². 435

According to legitimacy theory, signaling theory, 436
 resource-based theory, and stakeholder theory, com- 437
 panies must be transparent and forthright with all 438
 parties involved, not just shareholders. As a re- 439
 sult, successful CSR and ESG adoption will lower 440
 risks while simultaneously enhancing financial per- 441
 formance and stakeholder satisfaction. Applying 442
 ESG, carbon control, and social responsibility will im- 443
 prove financial performance. The study proposes the 444
 following hypothesis: 445

H_1 : ESG and carbon control have a positive impact 446
 on firm performance. 447

Firms may have to pay additional fees for excess emis- 448
 sions and submit more information to the govern- 449
 ment due to environmental restrictions, which could 450

Table 1: Sumarize variables

Variables	Explanation	Source
Dependent variable		
Q	TobinQ	
ROA	Return on Assets	Refinitiv
ROE	Return on Equity	Refinitiv
Independent variable		
ESG	ESG score	Refinitiv
ESGCon	The ESG controversies score is calculated based on 23 ESG controversy topics.	Refinitiv
ENV	Environment score	Refinitiv
SOC	Social score	Refinitiv
GOV	Governance	Refinitiv
CSRStra	CSR strategy category score reflects a company’s practices in communicating in that it integrates the economic (financial), social, and environmental dimensions into its day-to-day decision-making processes.	Refinitiv
CSRC	CSR committee score	Refinitiv
CSRS	CSR Reporting score	Refinitiv
CSRAudit	Does the company have an external auditor for its CSR/Sustainability reports? Dummy variable. If True: 0, False: 1	Refinitiv
CSRSCommittee	Does the company have a CSR committee? Dummy variable. If True: 0, False: 1	Refinitiv
Emissions	Emission category score measures a company’s commitment and effectiveness toward reducing environmental emissions in production and operational processes.	Refinitiv
Total carbon	CO2 total = direct (scope 1) + indirect (scope 2)	Refinitiv
LEV	Total debt on Total Assets	
DE	Total debt on Equity	
SDA	Short-term debt on Total assets	
LDA	Long-term debt on Total assets	

Source: Author summarizes

451 raise their expenses. As a result, the value of busi- 463
 452 nesses directly impacted by the new carbon rules will 464
 453 be lower than that of businesses undamaged by the 465
 454 regulations⁵³. 466
 455 Jensen and Meckling’s agency theory offers another 467
 456 viewpoint on the relationship between ESG and fi- 468
 457 nancial performance⁴³. This idea suggests that man- 469
 458 agers might not give ESG initiatives the greatest atten- 470
 459 tion because they assume that doing so could harm 471
 460 shareholder interests and decrease profits. However, 472
 461 managers must consider the firm’s short-term and 473
 462 long-term interests of the firm in the current environ- 474

ment, since investors’ concerns about ESG elements 463
 are growing. 464
 The impact of ESG regulations and carbon controls 465
 on corporate financial performance is not always neg- 466
 ative. For companies with high financial perfor- 467
 mance, investing in sustainable activities can bring 468
 many long-term benefits such as improving brand im- 469
 age and attracting ESG-conscious customers and in- 470
 vestors. Conversely, companies with low financial 471
 performance may have more difficulty implementing 472
 these activities due to lack of resources. Therefore, de- 473
 pending on the characteristics of each firm, there will 474

Table 2: Calculation of pillar scores⁴⁸

Pillar	Category	Score	Weight	Sum of category Weight	Pillar scores
Environment	Emissions	0.98	0.15	0.44	0,94

475 be a separate strategy for ESG practices, CSR as well
 476 as appropriate carbon control policies.
 477 H₂: The impact of implementing social responsibility
 478 and carbon control on financial performance varies by
 479 quartile.

480 **EMPIRICAL RESULTS**

481 **The impact of ESG, carbon control on business performance**

483 **The impact of ESG, carbon control on Quantile business performance**

485 **DISCUSSION**

486 emonstrates a positive correlation between ESG
 487 scores and financial performance. This suggests that
 488 disclosing information on social responsibility imple-
 489 mentation can enhance corporate value. Stakeholder
 490 theory supports this relationship, positing that so-
 491 cial responsibility builds shareholder trust, leading to
 492 long-term value creation, which aligns with this per-
 493 spective’ Sroufe and Gopalakrishna-Remani⁵⁴. Sinha
 494 Ray and Goel proves that ESG score was positively
 495 associated with financial performance indicators⁵⁵.
 496 This demonstrates the benefits of disclosing informa-
 497 tion on social responsibility implementation through
 498 environmental, social, and governance factors. Ac-
 499 cording to stakeholder theory, implementing social
 500 responsibility helps build shareholder trust and bring
 501 future value. This finding is consistent with previous
 502 research⁵⁴.

Q has been positively influenced by ESG Contro- 503
 versy, which is statistically significant at the 1% level. 504
 As a result, initiatives to resolve new problems im- 505
 prove financial performance and lessen financial lim- 506
 itations. Additionally, companies that actively tackle 507
 social and environmental challenges are more likely 508
 to draw investors who share their values⁵⁶. 509
 Implementing a CSR strategy has a favorable and sig- 510
 nificant impact on financial performance (ROA, ROE, 511
 Q), according to CSRstra. According to stakeholder 512
 theory, a firm’s ability to succeed depends on its abil- 513
 ity to collaborate with its stakeholders, who offer both 514
 tangible and intangible resources that are necessary 515
 for its survival. These resources include labor (em- 516
 ployees), working conditions public services (govern- 517
 ment agencies), and financial resources (sharehold- 518
 ers). As such, the firm must inform stakeholders 519
 about its business operations rather than just own- 520
 ers^{57,58}. Stakeholder satisfaction and financial per- 521
 formance will both increase with effective CSR and 522
 ESG management⁵⁹. Integrating CSR plans with firm 523
 development strategies will guide social responsibility 524
 practices in their business activities ethically and re- 525
 sponsibly. Gradually, these practices are incorporated 526
 into their corporate culture, guiding business activi- 527
 ties to be ethically and responsibly sustainable. This 528
 leads to improved corporate reputation in the market 529
 and increased credibility, which in turn leads to im- 530
 proved access to finance⁵⁶. 531
 ROA is positively impacted by the emission score 532
 (Emission); ROE and Q are negatively affected. The 533

Source: Results of data processing from Stata

534 findings demonstrate that FP benefits from deploy- 586
 535 ing emission reduction (high Emission), consistent 587
 536 with numerous research^{21,22}. This study supports 588
 537 the idea that incorporating sustainable practices such 589
 538 as reducing emissions can improve a firm's competi- 590
 539 tiveness and overall performance⁶⁰. This finding re- 591
 540 inforces the view that integrating sustainable prac- 592
 541 tices, including emissions reduction, can positively 593
 542 contribute to a firm's overall performance and com- 594
 543 petitiveness⁵⁹. 595

544 Total carbon overall has a negative effect on ROE and 596
 545 a positive influence on Q [659], there is a substantial 597
 546 inverse link between corporate value and carbon to- 598
 547 tal. According to Zhang and Vigne⁵⁹, the finance- 599
 548 reduction strategy penalizes companies that produce 600
 549 a lot of pollution; thus, these companies also have 601
 550 sluggish revenue growth and bad profitability. More- 602
 551 over, a firm's financial performance can be impacted 603
 552 by lowering its carbon emissions in several ways⁶¹. 604

553 Components of scores E, S, and G have a detrimen- 605
 554 tal effect on financial performance. According to sev- 606
 555 eral studies, there is a negative correlation between 607
 556 firm financial performance and environmental per- 608
 557 formance⁶²⁻⁶⁴. The main theoretical explanation is 609
 558 that environmental issues increase the management 610
 559 costs of firms and reduce FP. One potential explana- 611
 560 tion is that firms with stronger corporate governance 612
 561 systems prioritise long-term investments over short- 613
 562 term profits. These investments may initially yield 614
 563 lower returns but have the potential for higher re- 615
 564 turns in the future. Focusing on long-term strategy 616
 565 and sustainability may make these firms sacrifice im- 617
 566 mediate profits, leading to a negative association be- 618
 567 tween environmental scores and ROE. Another ex- 619
 568 planation could be that firms with strong corporate 620
 569 governance structures incur additional costs related 621
 570 to regulatory compliance and ethical practices. In ad- 622
 571 dition, studies by Baatour and Ben Saada, Kabir et al 623
 572 highlight the global diversity in governance practices, 624
 573 indicating that cultural and institutional differences 625
 574 significantly influence the effectiveness of governance 626
 575 mechanisms in improving firm performance^{65,66}. 627

576 Similarly, the impact of social criteria (SOC) on FP 628
 577 shows an inverse effect: The negative association be- 629
 578 tween SOC and ROE suggests that firms with higher 630
 579 SPS scores tend to have lower ROE. This may be be- 631
 580 cause firms focusing more on social responsibility 632
 581 may be less focused on profit maximization. 633

582 The regression findings demonstrate a strong posi- 634
 583 tive correlation between the firm's performance, as 635
 584 measured by ROE and ROA, and its financial struc- 636
 585 ture, as measured by total debt. The findings show 637

that decisions about capital structure financing favor- 586
 ably impact on financial success. This only applies 587
 to short-term debt, though. Both ROA and ROE are 588
 negatively and negligibly impacted by long-term debt. 589
 These findings bolster the notion of the pecking order, 590
 which is based on actual data showing a negative cor- 591
 relation between capital structure and organizational 592
 profitability⁶⁷. Tobin's Q and financial leverage have a 593
 positive association; however, ROA, ROE, and finan- 594
 cial leverage have negative correlations. 595

ESG's effect on financial performance differs based on 596
 the ROA, ROE, and Q quantiles are presented in Ta- 597
 bles 4, 5 and 6 . In other words, the impact of ESG 598
 may differ based on the enterprise's size and present 599
 level of profitability. 600

The effects of the environmental, social, and gover- 601
 nance (ESG) components change and are not ongoing 602
 across quantiles. Reducing pollutants, for instance, 603
 can increase profits, but not all businesses will benefit 604
 from this. 605

Although implementing ESG principles can benefit 606
 firms in many ways, they are unlikely to result in in- 607
 stant improvements in financial performance. Busi- 608
 nesses must carefully assess internal and external fac- 609
 tors to make the right investment choices. 610

The ESG score variable with high percentiles of ROA 611
 has a shift in impact sign from positive to negative at 612
 the 25th percentile, and the impact becomes positive 613
 again at the 90th percentile. At the 25th percentile, 614
 businesses in this percentile often have low business 615
 efficiency. Investing in ESG can disperse resources, 616
 leading to a decrease in ROA in the short term. At the 617
 50th percentile, at the average percentile, improving 618
 the ESG score can lead to increased costs and reduced 619
 short-term profits due to activities such as investing 620
 in green technology and improving working condi- 621
 tions. The ESG score positively impacts ROE at the 622
 10th and 90th percentiles but is not statistically sig- 623
 nificant. When the ESG score increases to a certain 624
 threshold, it begins to have a positive impact on ROE. 625
 Companies in the 10th and 90th percentiles may have 626
 reached this threshold, while companies in the other 627
 percentiles have not. Although it is not statistically 628
 significant, the ESG score improves Q at the 10th and 629
 90th percentiles. The ESG Problematic Score (ESG- 630
 Con) is only statistically significant at the 25th and 631
 75th quantiles, but it has a favorable effect on Q at all 632
 quantiles. 633

The ESG Controversy Score (ESGCon) positively im- 634
 pacts ROA at all percentiles and is statistically sig- 635
 nificant at the 25th and 75th percentiles. While it 636
 has a positive impact on ROE at all percentiles and is 637

only statistically significant at the 25th and 75th percentiles. This means that the more actively companies in these two percentiles address ESG issues, the higher their return on equity. Effectively handling ESG controversies helps firms reduce legal, reputational, and financial risks for firms.

CSR Strategy (CSRStr) positively impacts on ROA at all quantiles but is not statistically significant. The benefits of CSR can be assessed at any size of enterprise. More and more investors, customers, and employees are concerned about ESG (Environmental, Social, and Governance) issues. Therefore, enterprises implementing CSR activities meet the needs of stakeholders. CSR Strategy (CSRStr) has a negative impact on ROE at all quantiles except 75 but is statistically significant at 50. The results of this study show that implementing a CSR strategy needs to be carefully considered and tailored to each enterprise. Although CSR can bring many long-term benefits, it also comes with short-term costs. Enterprises need to find a balance between business goals and social responsibility. Except for the 75th quantile, CSR Strategy (CSRStr) has a negative effect on Q; nonetheless, this effect is statistically significant at the 50th quantile.

CSR Committee (CSRCS) positively impacts ROA at the 10th, 25th, 50th, and 90th percentile but negatively at the 75th percentile. The publication of CSR reports demonstrates the transparency and responsibility of enterprises, thereby enhancing reputation, attracting customers and investors, and helping enterprises increase profits. CSR Council (CSRC) positively impacts ROE at the 10th, 25th, 50th, and 90th percentiles but negatively at the 75th percentile. CSRC helps enterprises monitor and manage CSR activities more effectively, minimize risks, and increase transparency. At the 10th, 25th, 50th, and 90th quantiles, CSR Committee (CSRCS) has a positive effect on Q; however, at the 75th quantile, it has a negative impact.

The publication of CSR reporting (CSRReport) positively impacts ROA at the 10th, 25th, and 75th percentiles but negatively impacts the 50th and 90th percentiles. The publication of CSR reports helps ensure published information's accuracy, objectivity, and transparency, enhancing the trust of investors, partners, and the public in enterprises. This may lead to an increase in stock prices and a decrease in the cost of capital, thereby increasing ROA. For high quantiles of ROA, the impact of CSR reporting is impractical because CSR reporting for these firms may require very high costs, leading to a decrease in ROA. CSR reporting (CSRReport) has a positive impact on ROE

at the 10th quantile and a negative impact at the 10th quantile. At every quantile, CSR Reporting (CSRReport) has a positive effect on Q; at the 75th quantile, it has a negative effect. Only at the 50th quantile does it become statistically significant.

The Emission score positively impacts ROA at all quantiles but is only statistically significant at the 25th and 50th quantiles. The results of this study show that efforts to reduce emissions are not only a social responsibility but also a business strategy, helping businesses increase profits. The Emission index score positively impacts ROE at all quantiles but is only statistically significant at the 50th quantile and has a negative effect. Emissions Score has a positive effect on Q at all quantiles but is only statistically significant at the 50th quantile and is negative at the 10th quantile

Total carbon has a negative impact on ROA at all quantiles but are not statistically significant. Total carbon emissions (CarbonTotal) have a negative impact on ROE at the 50th, 75th, and 90th quantiles, but are not statistically significant. Total carbon emissions tend to have a negative impact on ROE at higher quantiles (50, 75, 90), although they do not reach statistical significance. This shows that reducing overall carbon emissions can benefit businesses in the long run. Total Carbon has a negative impact on Q at the 50th, 75th, and 90th quantiles but is not significant statistically significant.

Environmental score (ENV) has a negative impact on ROA at the 10, 25, 75, and 90 percentiles, but is not statistically significant, positive impact at the 50 percentile. Meanwhile, Social score (SOC) has a negative impact on ROA at the 10 and 25 percentiles, and is statistically significant at the 10 percentile. Positive impact at the 50, 75, and 90 percentiles, but is not statistically significant. Governance score (GOV) has a negative impact on ROA at the 10, 90 percentiles, but is not statistically significant. Positive impact at the 25, 50, 75 percentiles, and is only statistically significant at the 50 percentile. The results of the analysis show that the relationship between environmental, social, and governance (ESG) factors and return on total assets (ROA) is complicated and does not completely follow a specific rule. There is considerable variation in this effect's sign and statistical significance across different quantiles. The environmental score (ENV) has a negative effect on ROE at the 50th, 75th, and 90th quantiles, but it is not statistically significant. It is positive at the 10th and 25th quantiles. The social score (SOC) has a negative impact on ROE at the 10th, 50th, and 90th quantiles. The effect is only statistically significant at the 10th quantile. It is positive at the remaining quantiles, but it is not statistically significant.

744 The governance score (GOV) has a negative effect on
 745 ROE at the 10th and 90th quantiles, but it is not statis-
 746 tically significant. The CSRAudit variable on ROA has
 747 a negative effect at the 75th quantile, but it is only sta-
 748 tistically significant at the 75th quantile. The CSRAu-
 749 dit variable has a negative effect on ROE at the 75th
 750 quantile, but it is statistically significant. The remain-
 751 ing quantiles have positive and statistically significant
 752 effects, except for the 90th quantile. Although it is
 753 not statistically significant, the Environmental Score
 754 (ENV) hurts Q at the 50th, 75th, and 90th percentiles.
 755 Impact in the 10th and 25th percentiles is positive.
 756 In contrast, Q is negatively impacted by Social Score
 757 (SOC) in the 10th, 50th, and 90th percentiles. Only at
 758 the 10th percentile is the influence statistically signif-
 759 icant. Although not statistically significant, there is a
 760 positive influence at the remaining percentiles. Q has
 761 been negatively affected by Social Score (SOC) in the
 762 10th and 90th percentiles, however this effect is not
 763 statistically significant.

764 The CSRCommittee variable has a negative impact on
 765 ROA at the 10th, 25th, and 50th percentiles, but is
 766 not statistically significant, and a positive impact at
 767 the 75th and 90th percentiles. The establishment of a
 768 CSRCommittee has a negative impact on ROE at the
 769 10th and 25th percentiles, is statistically significant at
 770 the 10th percentile, and has a positive effect on the re-
 771 maining percentiles but is not statistically significant.
 772 The results of this study show that the impact of the
 773 CSR Committee on ROE is complex and depends on
 774 many factors

775 Although it is not statistically significant, the Environ-
 776 mental Score (ENV) hurts Q at the 50th, 75th, and
 777 90th percentiles. Impact in the 10th and 25th per-
 778 centiles is positive. In contrast, Q is negatively im-
 779 pacted by Social Score (SOC) in the 10th, 50th, and
 780 90th percentiles. Only at the 10th percentile is the
 781 influence statistically significant. Although not sta-
 782 tistically significant, there is a positive influence on
 783 the remaining percentiles. Q has been negatively af-
 784 fected by Social Score (SOC) in the 10th and 90th per-
 785 centiles, however this effect is not statistically signifi-
 786 cant.

787 There is a statistically significant negative effect of
 788 CSRAudit on ROA on Q at the 75th percentile. Ex-
 789 cept for the 90th quantile, all other quantiles exhibit
 790 beneficial and statistically significant impacts.

791 Short-term debt (SDA) has a positive impact on ROA
 792 at the 10th percentile, and is statistically significant,
 793 except for the 10th percentile. Long-term debt (LDA)
 794 has a negative impact on ROA at the 75th and 90th
 795 percentiles. Meanwhile, the Debt ratio (LEV) has a
 796 negative impact on ROA at the 75th percentile and

is statistically significant at the 75th and 90th per- 797
 centiles. The Debt-to-equity ratio (DE) has a nega- 798
 tive impact on ROA at the 25th percentile and a pos- 799
 itive impact at the remaining percentiles and is sta- 800
 tistically significant at the 10th percentile. The analy- 801
 sis results show that the relationship between debt in- 802
 dicators (short-term debt, long-term debt, total debt, 803
 debt-to-equity ratio) and return on total assets (ROA) 804
 is quite complicated and depends on the debt struc- 805
 ture of the enterprise. This shows that using debt as a 806
 financial tool needs to be carefully considered to opti- 807
 mize business efficiency. Short-term debt (SDA) has 808
 a positive impact on ROE at all quantiles and is statis- 809
 tically significant. Long-term debt (LDA) has a nega- 810
 tive impact on ROE at the 10th, 75th, and 90th quan- 811
 tiles, and is not statistically significant. The remaining 812
 quantiles have a positive impact, and are statistically 813
 significant at the 25th quantile. Debt ratio (LEV) has 814
 a negative impact on ROE at all quantiles and is sta- 815
 tistically significant. The Debt-to-equity ratio (DE) 816
 has a negative impact at the 10th quantile and a pos- 817
 itive impact at the remaining quantiles and is statis- 818
 tically significant at the 50th and 90th quantiles. Simi- 819
 lar to ROA, the use of debt can help increase ROE but 820
 also comes with financial risks. Enterprises need to 821
 carefully consider the benefits and risks to choose the 822
 appropriate capital structure. Short-term debt (SDA) 823
 has a positive effect on Q at all quantiles and is statis- 824
 tically significant. Long-term debt (LDA) hurts Q at the 825
 10th, 75th, and 90th quantiles, and is statistically sig- 826
 nificant at the 90th quantile. The remaining quantiles 827
 have a positive effect and are statistically significant 828
 at the 25th quantile. The debt ratio (LEV) hurts Q at 829
 the 10th quantile, and is statistically significant at the 830
 50th and 90th quantiles. 831

832 CONCLUSION AND FUTURE 833 RESEARCH

834 Using Refinitiv Eikon data, this research explored the 834
 effects of ESG and carbon control on the financial per- 835
 formance of firms across the ASEAN6 region. Empir- 836
 ical evidence suggests a positive correlation between 837
 ESG practices, CSR strategy, and firm performance 838
 metrics such as ROA, ROE, and Q. While carbon re- 839
 duction efforts also demonstrated a positive impact, 840
 the study found that the influence of individual ESG 841
 dimensions varies, indicating a nuanced relationship 842
 between ESG and financial performance. 843

844 According to Shiller, financial markets are crucial in 844
 encouraging corporations to engage in social activi- 845
 ties⁶⁸. To draw in investors and strengthen corporate 846
 accountability, full and open disclosure of ESG infor- 847
 mation to stakeholders is essential⁶⁹. 848

849 According to the study's findings, ESG generally im- 903
 850 proves financial performance. The emission index 904
 851 positively impacts the performance of businesses. To 905
 852 detect the trend, future research must, however, con- 906
 853 sider the influence of the nonlinear relationship be- 907
 854 tween financial performance and the adoption of so- 908
 855 cial responsibility. Additionally, it must confirm the 909
 856 impact at the industry level, impact on financial struc- 910
 857 ture, and financial efficiency based on field-specific 911
 858 characteristics and methods. Due to data limitations, 912
 859 future studies must further consider carbon metrics 913
 860 and corporate social responsibility (ESG) practices. 914
